Hotels ..... 36

## How Finance Determines Capitalization Rates and Gross Income Multipliers

## Background

Finance estimates the market value of some properties using the "income" approach. We use the income approach for: office buildings, factories, warehouses, hotels, stores, and apartment buildings, including cooperatives and condominiums.

Finance uses two income approaches to determine the market value of property. One approach involves the determination of a capitalization rate and the other involves the determination of a gross income multiplier.

This document details how we determine capitalization rates and gross income multipliers each year.

## Capitalization Rates

Finance uses the "Band of Investment" approach to develop capitalization rates. The Band of Investment approach requires Finance to do three things:

1. Determine the mortgage equity ratio-the relationship between mortgage and equity for properties. How much equity is an owner required to put in by banks to purchase a property. This year's mortgage equity ratios ranged from 65\%to $55 \%$
2. Determine the interest rate for mortgages as close to J anuary $5^{\text {th }}$ as possible. This year interest rates for mortgages range from $5.49 \%$ to $10.37 \%$
3. Determine the rate of return on equity. Finance estimates the rate of return on equity as follows:
a. First, we look at the rate of return on a safe investment. Finance uses the Aaa and Baa bond rate. We use a bond rate based on a date as close to J anuary $5^{\text {th }}$ as possible
b. Second, because real estate cannot be sold overnight like a treasury note, we add points for illiquidity.
c. Third, because real estate must be managed unlike a bond or Treasury note, we add points for management.
d. The median add-ons for illiquidity and management are $5.75 \%$ and $2.00 \%$ respectively. As a result our equity rates range from $11.10 \%$ to $16.10 \%$

## How the Capitalization Rate Formula Works

The capitalization rate formula in its simplest form once Finance determines all of the factors is: Capitalization Rate $=($ Mortgage Ratio $*$ Mortgage Rate $)+($ Equity Ratio $*$ Equity Rate $)$.

So if Finance determines that:

1. The mortgage equity ratio for office buildings is $65 \% 35 \%$ (an owner purchasing property would be able to get a mortgage covering $65 \%$ of the purchase price and would need to contribute $35 \%$ in equity);
2. The mortgage interest rate is $6.75 \%$
3. The Aaa-- bond rate is $6.34 \%$
4. The adj ustment for:
a. illiquidity is $1.50 \%$ and
b. management is $0.75 \%$

Then the overall capitalization rate would be $7.39 \%$ ( $65 \%$ mortgage $* 6.75 \%$ mortgage interest rate) $+(35 \%$ equity $* 8.59 \%$ equity rate of return).

[^0]
## Gross Income Multipliers for Residential Properties

Finance developed its gross income multipliers in a two-step process. First, we set the income band ranges. Second we establish the multipliers.

Income Band Ranges: Finance's income band ranges are based on income information that we receive from owners of rental properties. The ranges reflect income information at ten different levels $-10^{\text {th }}, 20^{\text {th }}, 30^{\text {th }}, 40^{\text {th }}$, Median, $60^{\text {th }}, 70^{\text {th }}, 80^{\text {th }}, 90^{\text {th }}$ percentiles, and above the $90^{\text {th }}$ percentile.

Gross Income Multiplier: Finance developed the gross income multipliers by estimating the market value for a sample of rental properties in each decile range. Finance used the income and expenses for the sample properties, developed a capitalization rate using the band of investment approach described above, and estimated a market value. Once we estimated the market values, we divided by the income for those properties to set the gross income multiplier for each income band.

Check on Gross Income Multipliers: To understand the impact of the gross income multipliers, we ran an analysis of what would be the taxes as a percent of gross income if the tax rates remain the same. Taxes as a percent of gross income range from $12.60 \%$ to $29.25 \%$

Capitalization Rate: This year's gross income multiplier summary sheet includes the capitalization rate for each income range.

## Gross Income Multiplier for Residential Properties with 6-10 Units.

We developed the Gross Income Multipliers for 6 to 10 units based on sales prices. We analyzed recent sales and estimated the income that those properties could generate if all units were rented on the open market. We calculated separate GIMs for each borough. We also reviewed GIM estimates from market sources such as Massey \& Knakal.

## Gross Income Multiplier for Hotels

We calculated capitalization rates for a sample of hotels. The percent change in capitalization rates were applied to the gross income multipliers. Last year's GIMs of 900 and 840 have been reduced to 840 and 795 respectively. We reduced the multipliers for super-luxury, luxury, class 1 and class 2 hotels gross income multipliers by $6.67 \%$ The multipliers class 2 and class 4 hotels were reduced by $5.36 \%$

The capitalization rates and gross income multipliers for all property types follow this description.

Trophy Office Buildings

| Midtown Trophy Building: |  |  |  |  |  |
